

# Preparation for your upcoming **Disinfection Service** Home and Vehicle care

## What service is being done?

A Disinfection Service will be conducted to reduce contamination by sanitising touchpoints, surfaces, and floors.

ULV disinfection by way of cold fogging will be used for large areas. These are small droplets of disinfectant dispersed to service large spaces quickly. The droplets are a wet vapour and will land on a surface, dry and get to work.

Biological sanitiser will be used to wipe touchpoints and surfaces.

## Prior to home treatment

To ensure maximum sanitisation of surfaces, please:

- Deactivate smoke alarm/s
- Clear surfaces of food items, paperwork and ensure loose items are removed and packed away safely
- Secure all personal items
- Pack all crockery and cutlery into a closed cupboard

## Vacate Treatment Areas

While the chemical itself is proven food safe, we do ask that you are not present during the treatment. The application is to disperse in the airspace, like a fog, and it will not be a pleasant environment to be in.

Access to treated areas can be granted in as little as 30mins (for a 3 bedroom home). The disinfectant takes up to 15mins to dry.

## Prior to vehicle treatment

- Please remove all personal items and remove any food items.
- Please leave vehicle in the driveway or front lawn in park position, and hand-brake on with ample space to open doors. Vehicles cannot be treated on the road due to safety factors.
- Turn on air conditioning and set it to mid level heat
- Select the internal recycle air option to ensure that all air conditioning ducts are flushed and disinfected
- Where possible all windows are clean, ensuring maximum results.
