

## Mosquito Management

Reducing numbers to tolerable levels at home

**The program has been designed to deal with all life stages of a mosquito in order to reduce the adult population and therefore the probability of being bitten.**

Mosquitoes are present all year round. Regular visits are required to manage mosquito populations for the long term.

It is recommended that treatments are no longer than 8 weeks apart. You may choose to have these regular services over a season or spaced throughout the year.

### HOW IS IT TREATED?

- Larvicide (granules) are applied to stagnant water - this addresses common breeding areas containing mosquito larvae
- Adulticide (spray) is applied to issue areas - reducing the adult mosquito population

### WHAT'S INCLUDED?

A detailed **inspection** of external areas such as outdoor entertaining, yards, potted plants and building entrances, will form the first part of the service.

This will be followed up with a **treatment** of issue areas using appropriate solutions. One external area will be thoroughly treated as well as building entrances.

Our qualified and experienced technicians will complete the service with thorough **recommendations** to address any conducive conditions. These recommendations form an integral part of this program as mosquitoes only require 1 bottle cap of water to breed!
